# Process Maps - Level Concepts

(adopted and modified  
by IDS Scheer)

# Process Maps - Level Concepts

(adopted  
and  
modified by  
IDS Scheer)

## Management Processes

## Core Processes

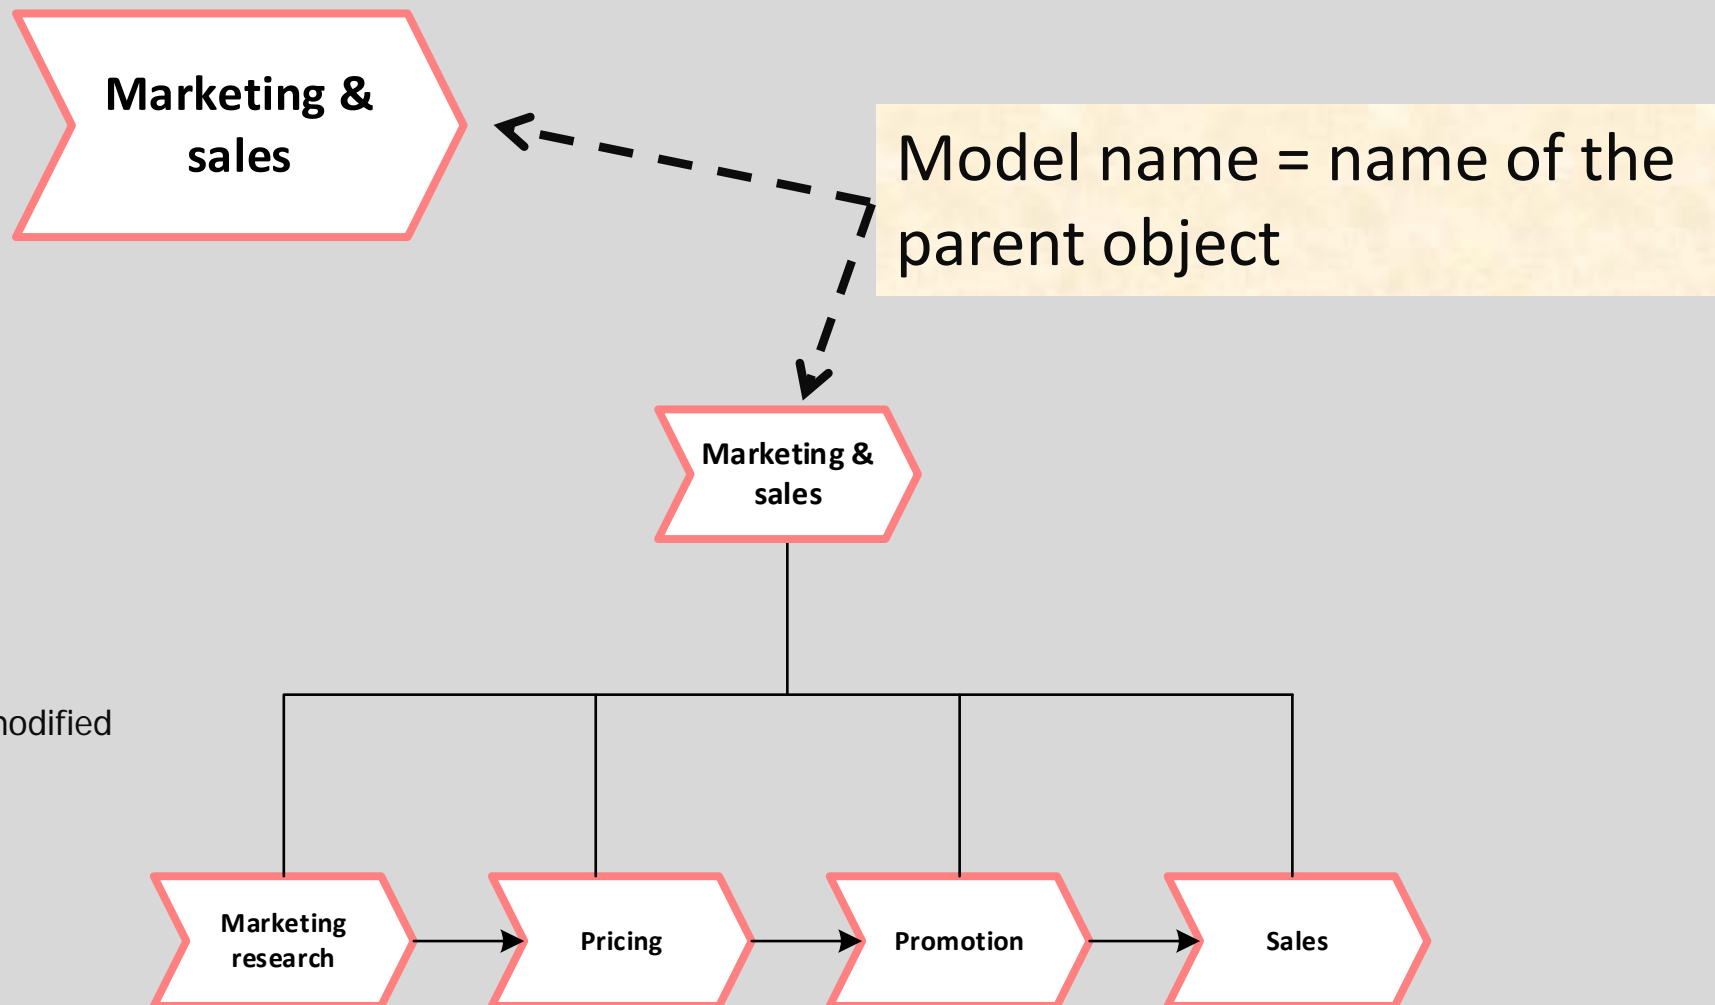

## Support Processes

Models that are hierarchized to an object take its name.

Process:

The name should be derived by one or more nouns or widespread adjective, prefix or suffix.

**Marketing &  
sales**

Other examples: Strategic Planning, Order Processing, Domestic Payments, Addressing Potential Customers

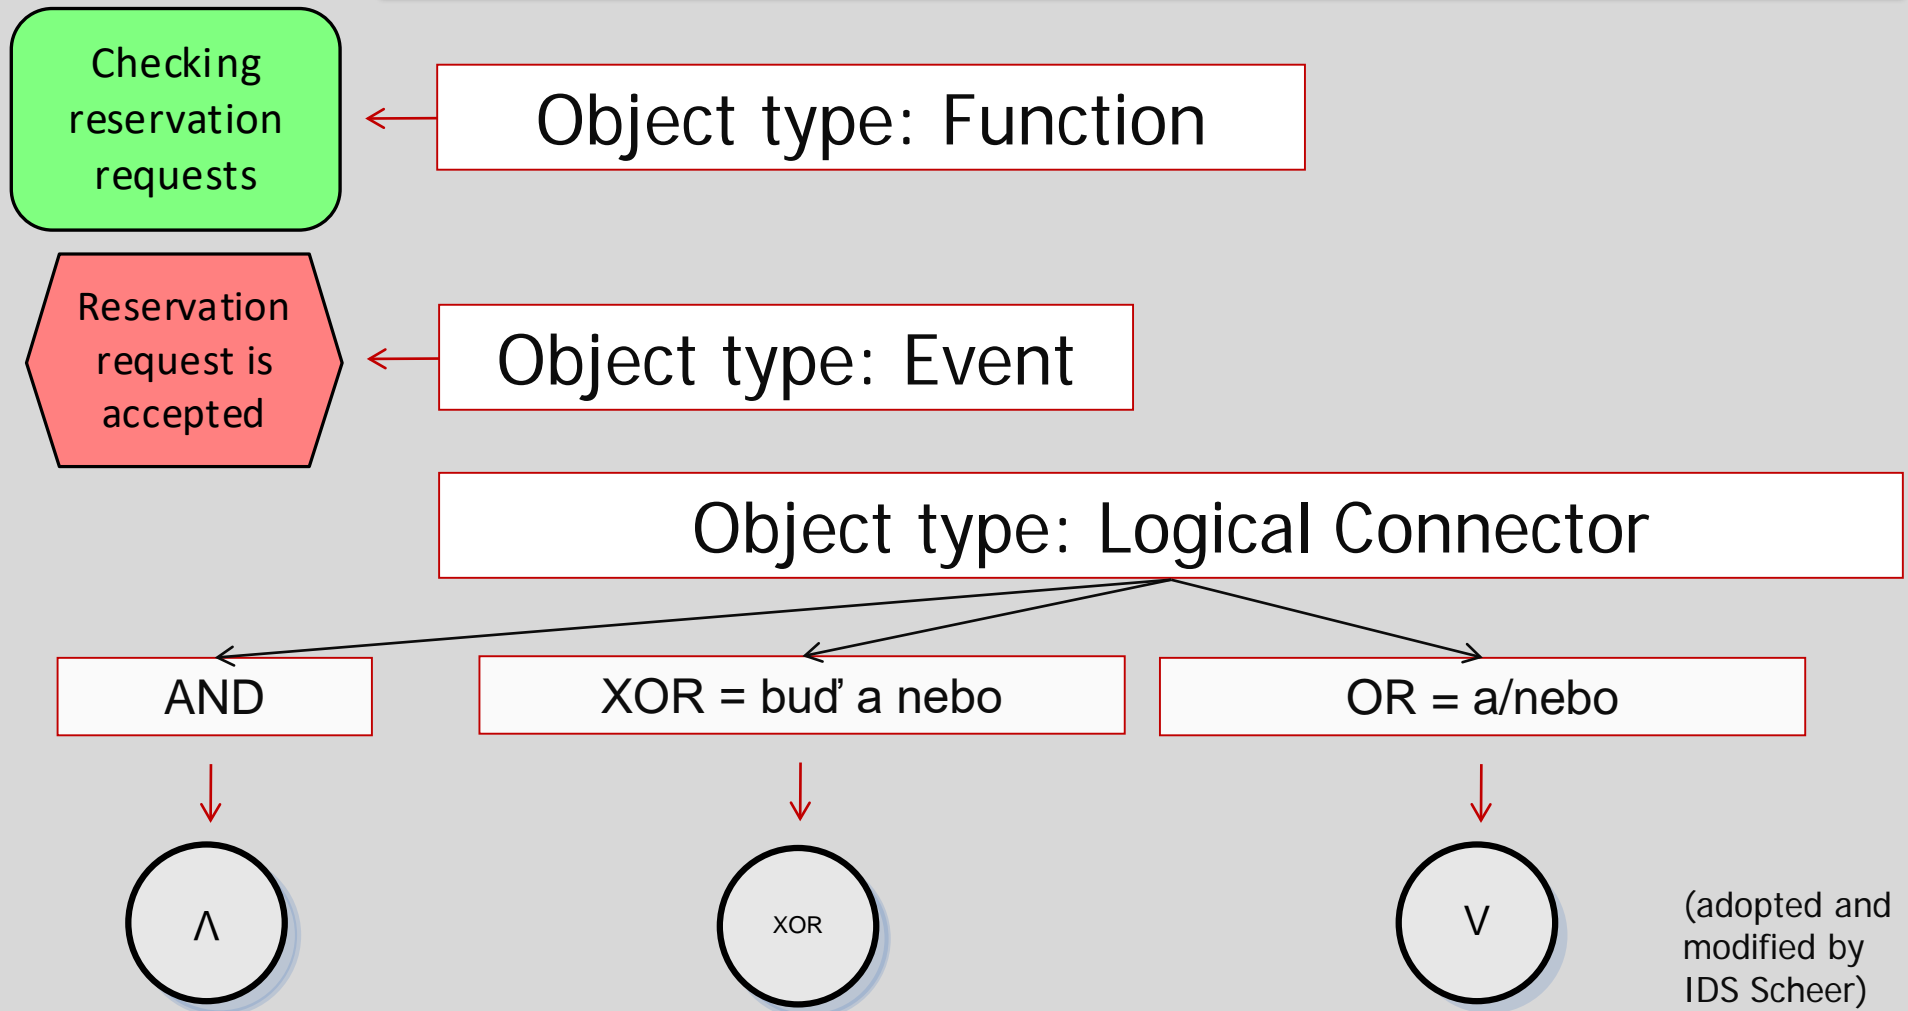

# Essence and creation of EPC (Event-driven Process Chain)

**Control flow display** is the chronological and logical sequence of each function in the process

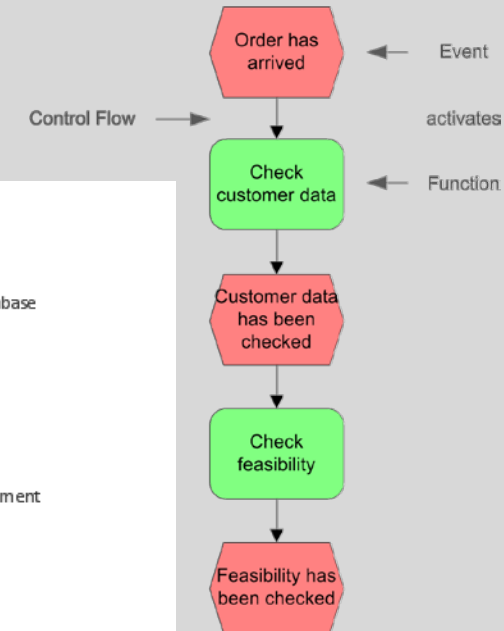

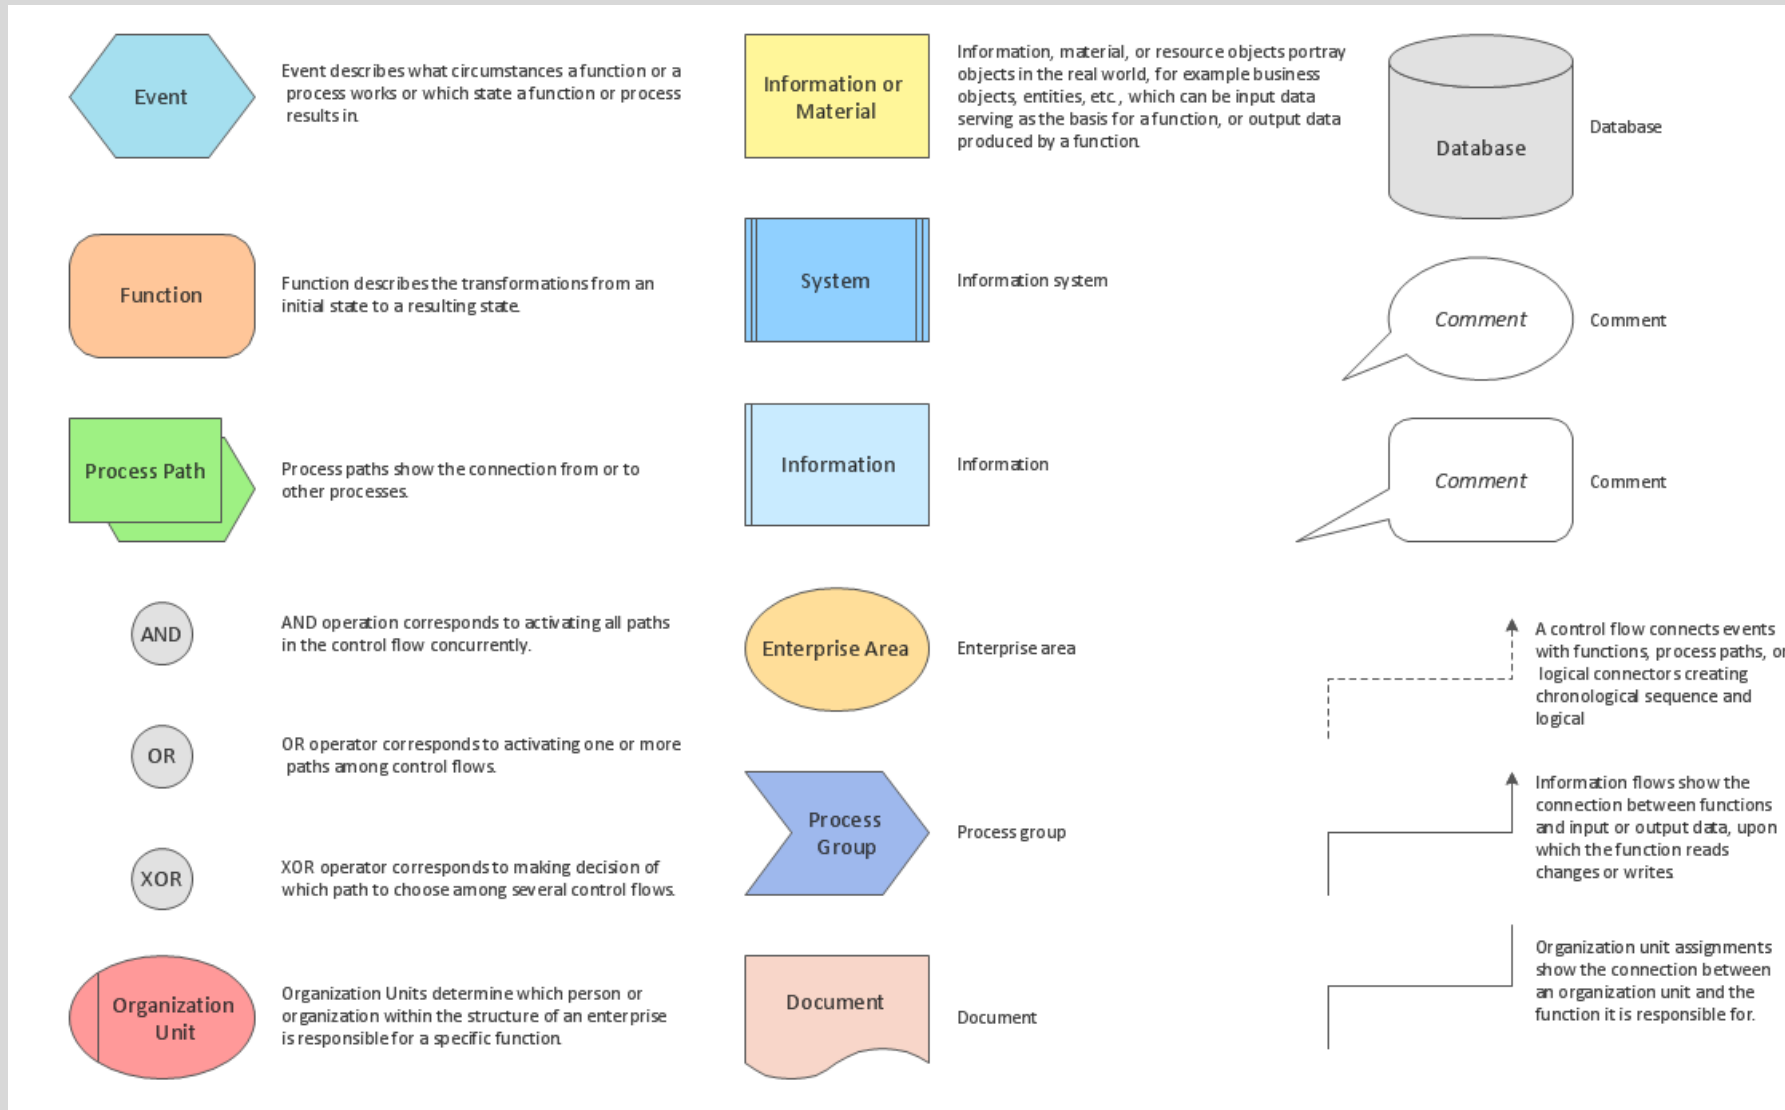

Basic elements for modeling the flow of control:

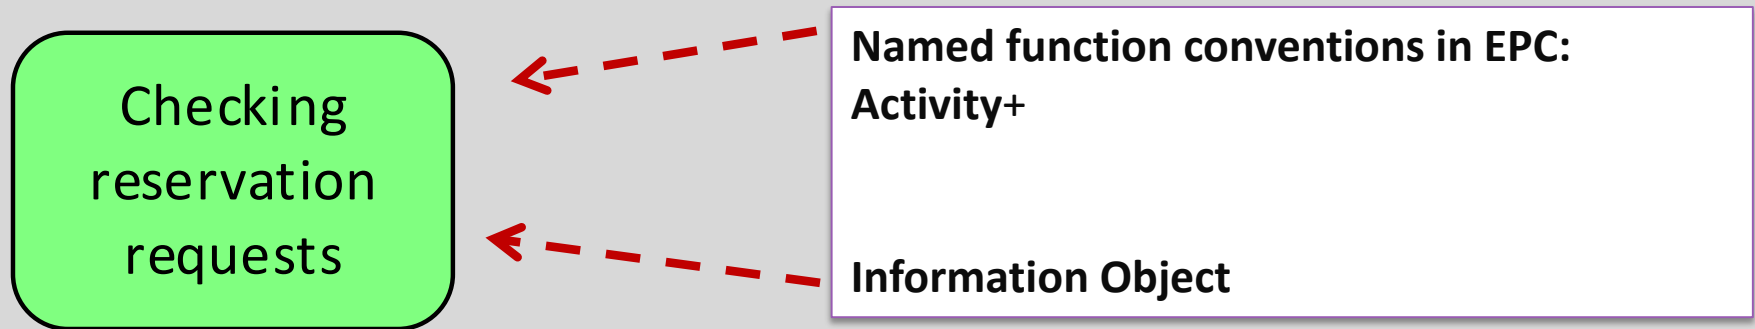

# EPC: Digram Design Elements

# Function: definitions and naming conventions

**Functions:** Expert task performed on an object supporting one or more goals.  
Synonyms: activity, activity, process step, procedure

## Event: definitions and naming conventions

**Event:** Describes the commercially relevant status of an information object that controls or affects the next process.

### Named conventions of event:

Information Object

Changing the state

## Event: definitions and naming conventions

After the decision making functions (testing):

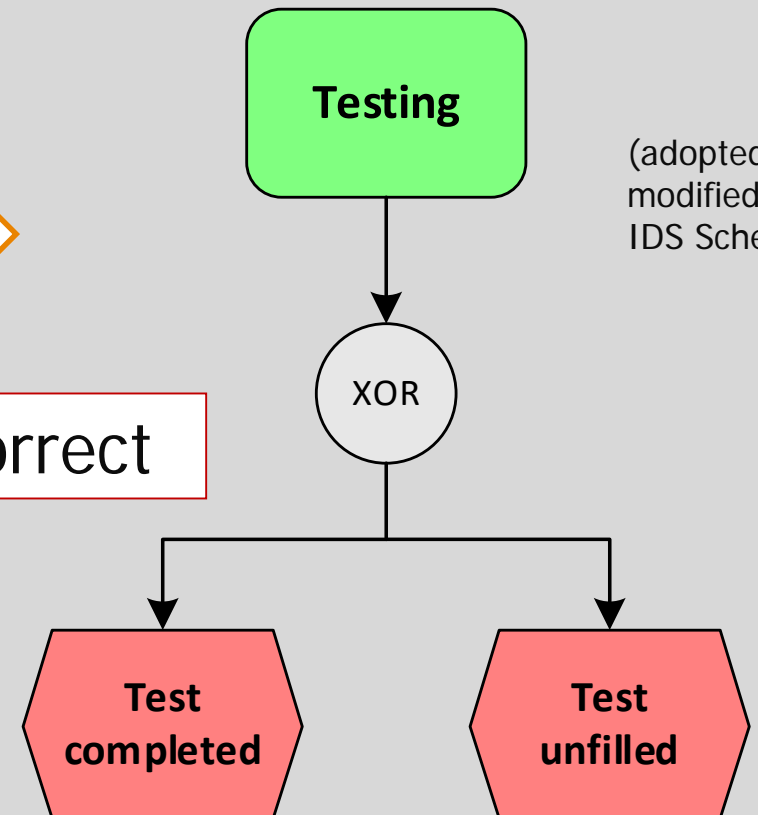

- **Incorrect:** "Tests performed,,
- **Correct:** Specify the possible test results (the test function usually has at least two mutually exclusive events)

Incorrect

Correct

(adopted and  
modified by  
IDS Scheer)

## Event: definitions and naming conventions

**The process path** (interface) is a symbol for the EPC Function object.

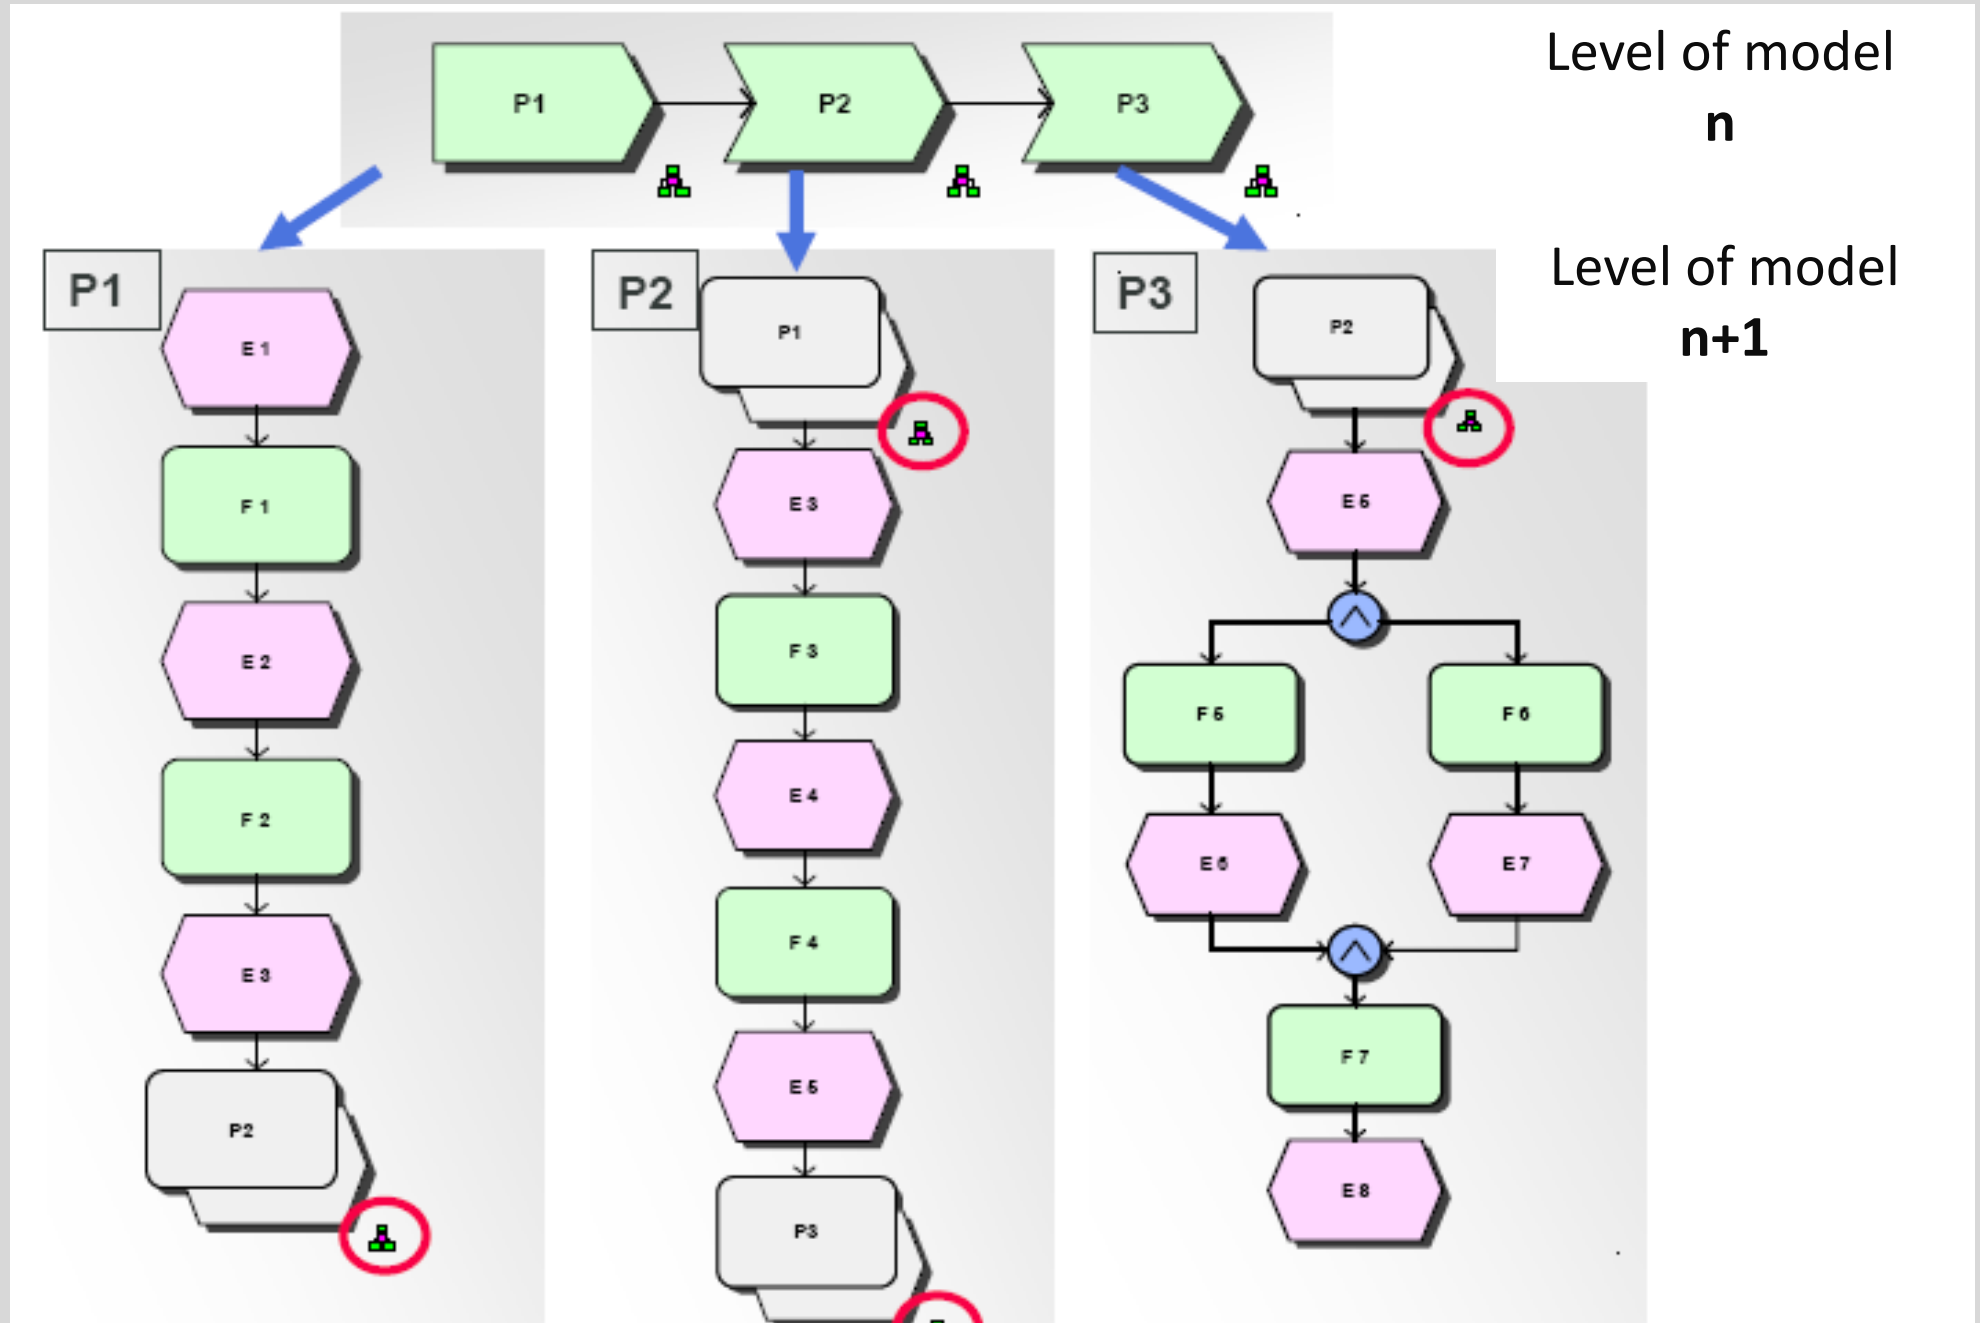

### **Process path are used:**

- demonstration of downstream and upcoming processes;
- to navigate to follow-up and upstream processes directly from the EPC (by opening the attached model).

## Process path (example)

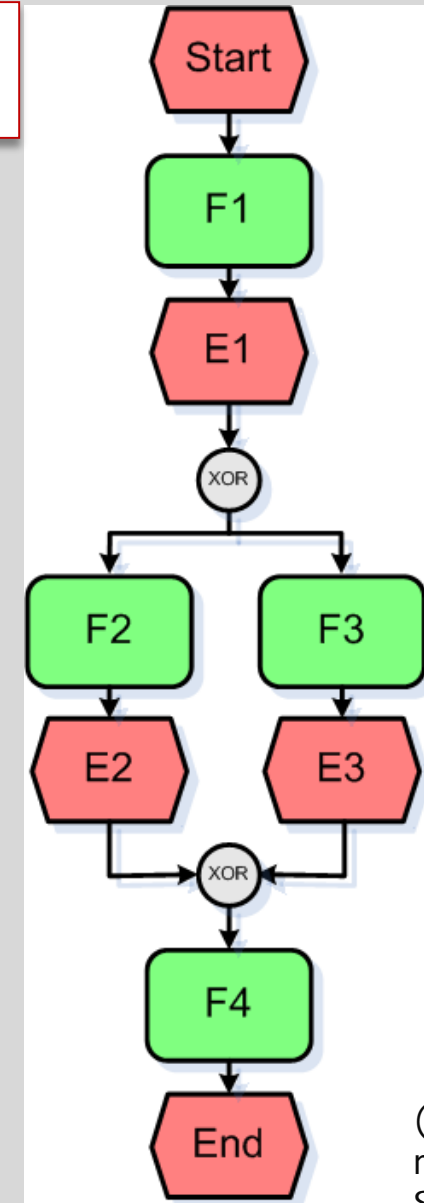

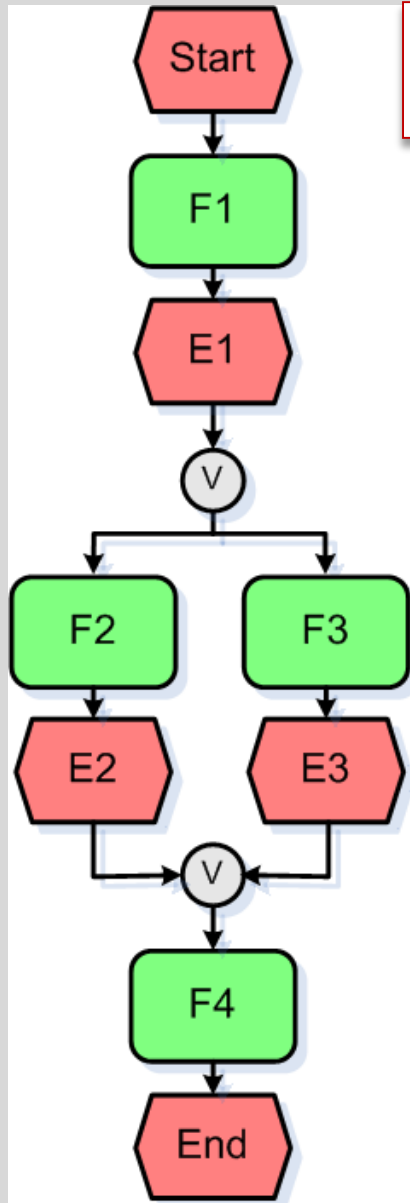

- Each EPC starts with at least one trigger event (or process interface).
- Each EPC ends with at least one end event (or process interface).
- The event is followed by either a function or an operand (the exception is the ending event).
- The function is followed by either an event or an operand.
- Each feature has one input connection and one output link (exception is end or input event).
- Each event has one input connection and one output link (the exception is the end or entry event).
- The Operand has either:
  - multiple input connections and one output link or
  - one input connection and multiple output connections.

## EPC: merging paths

The paths must be merged with the same operand that was used for branching.

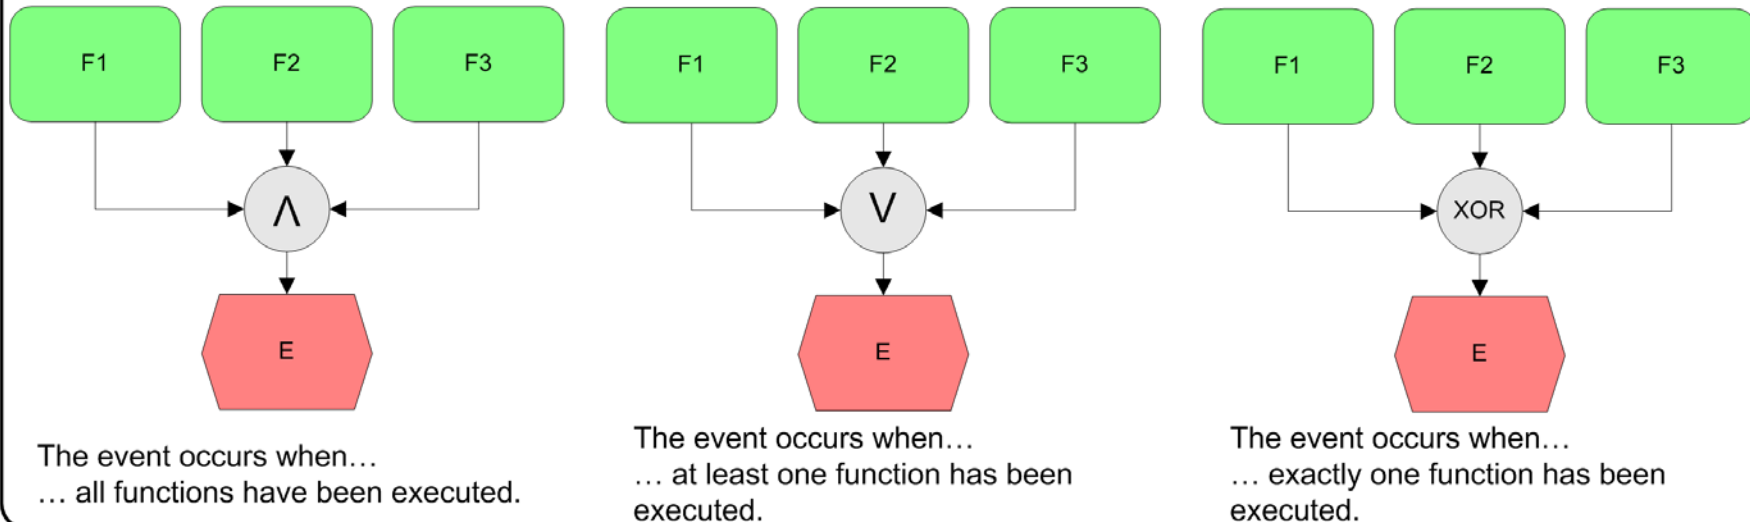

(adopted and  
modified by IDS  
Scheer)

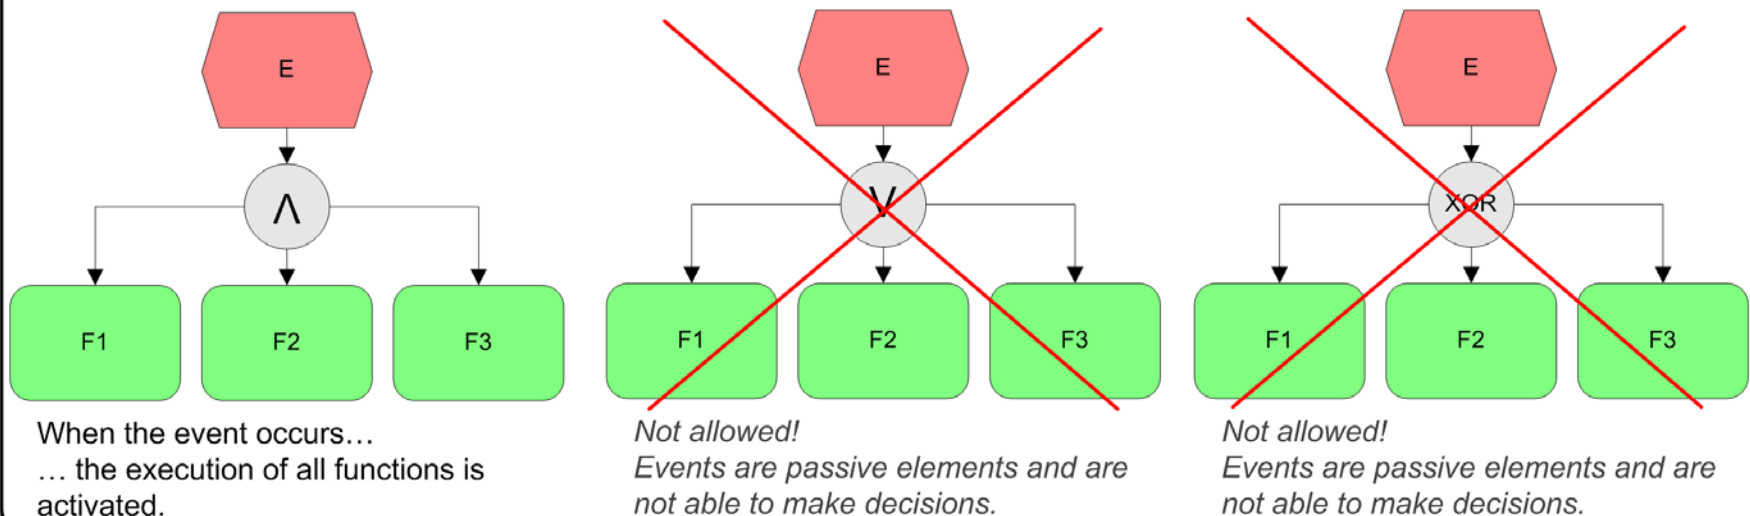

## Logical interconnection of several functions which have been executed:

## Logical interconnection of several functions to be executed:

## EPC: příklad operandu OR

## Process representation by text:

- Flights are registered by Mrs. Novak in the LETREGISTR system. Customer data is required as input.

## Diagram representation of the process:

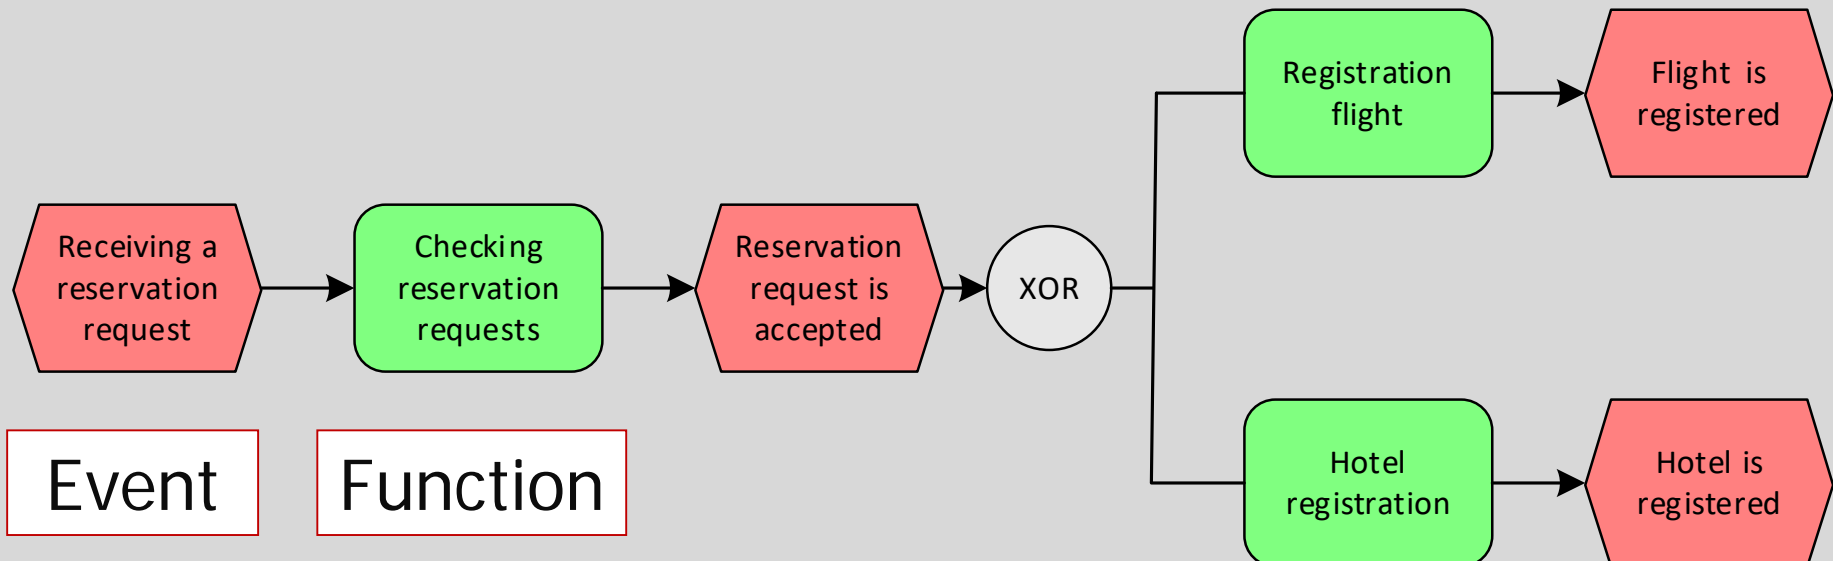

Representation of the process in the following table:

A	B	C	D
Activity (function)	Organization unit	IT system	Input data
<b>Flight booking</b>	Mrs. Novak	Flight register	<b>Customer data</b>

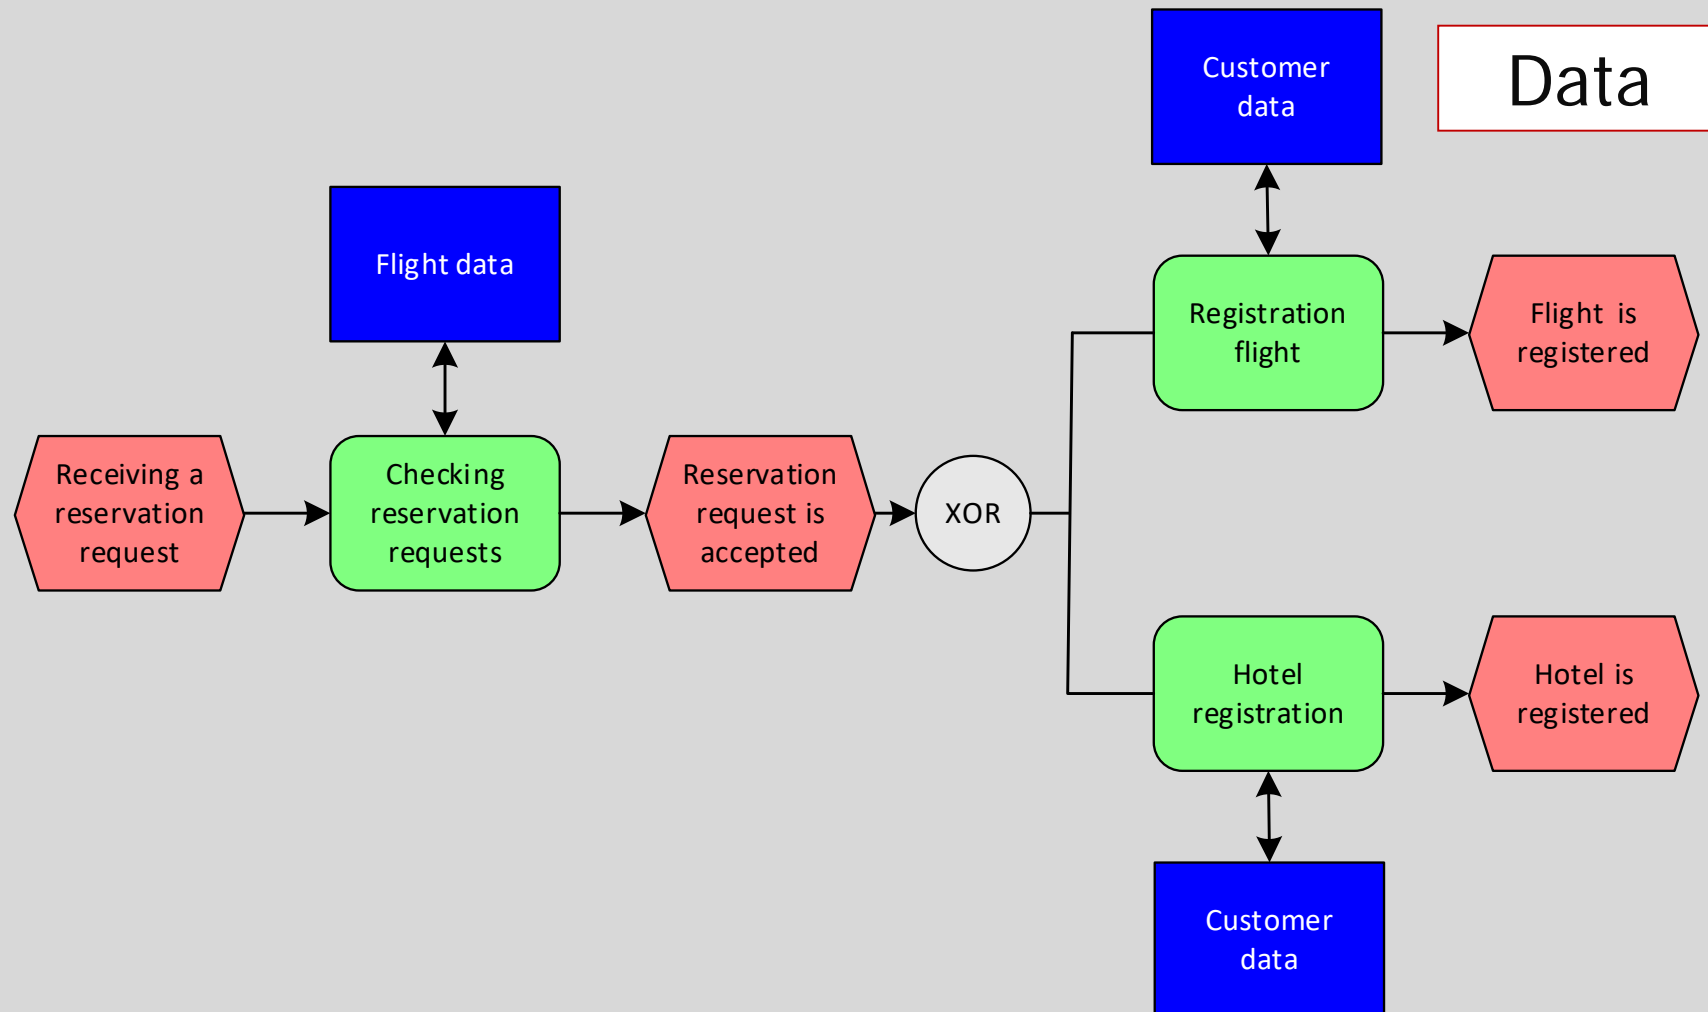

Events initiate functions.

Functions create events.

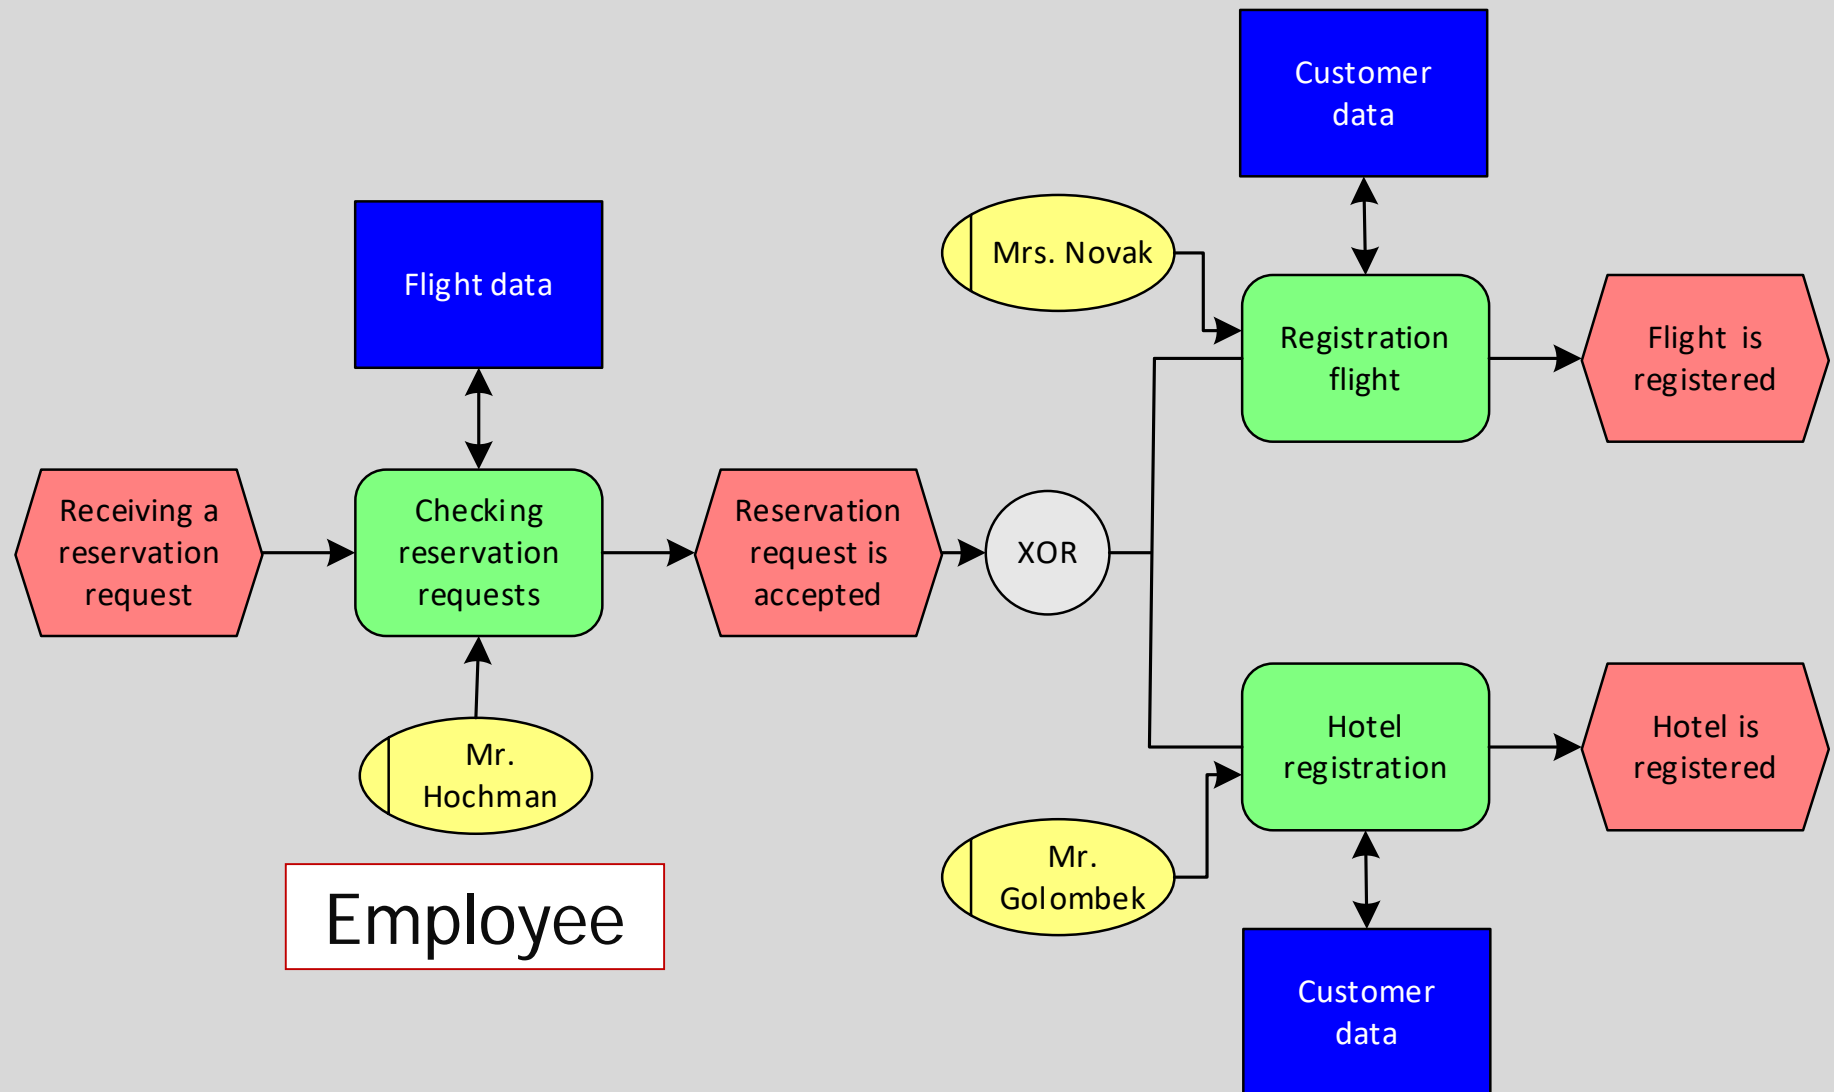

Functions process data.

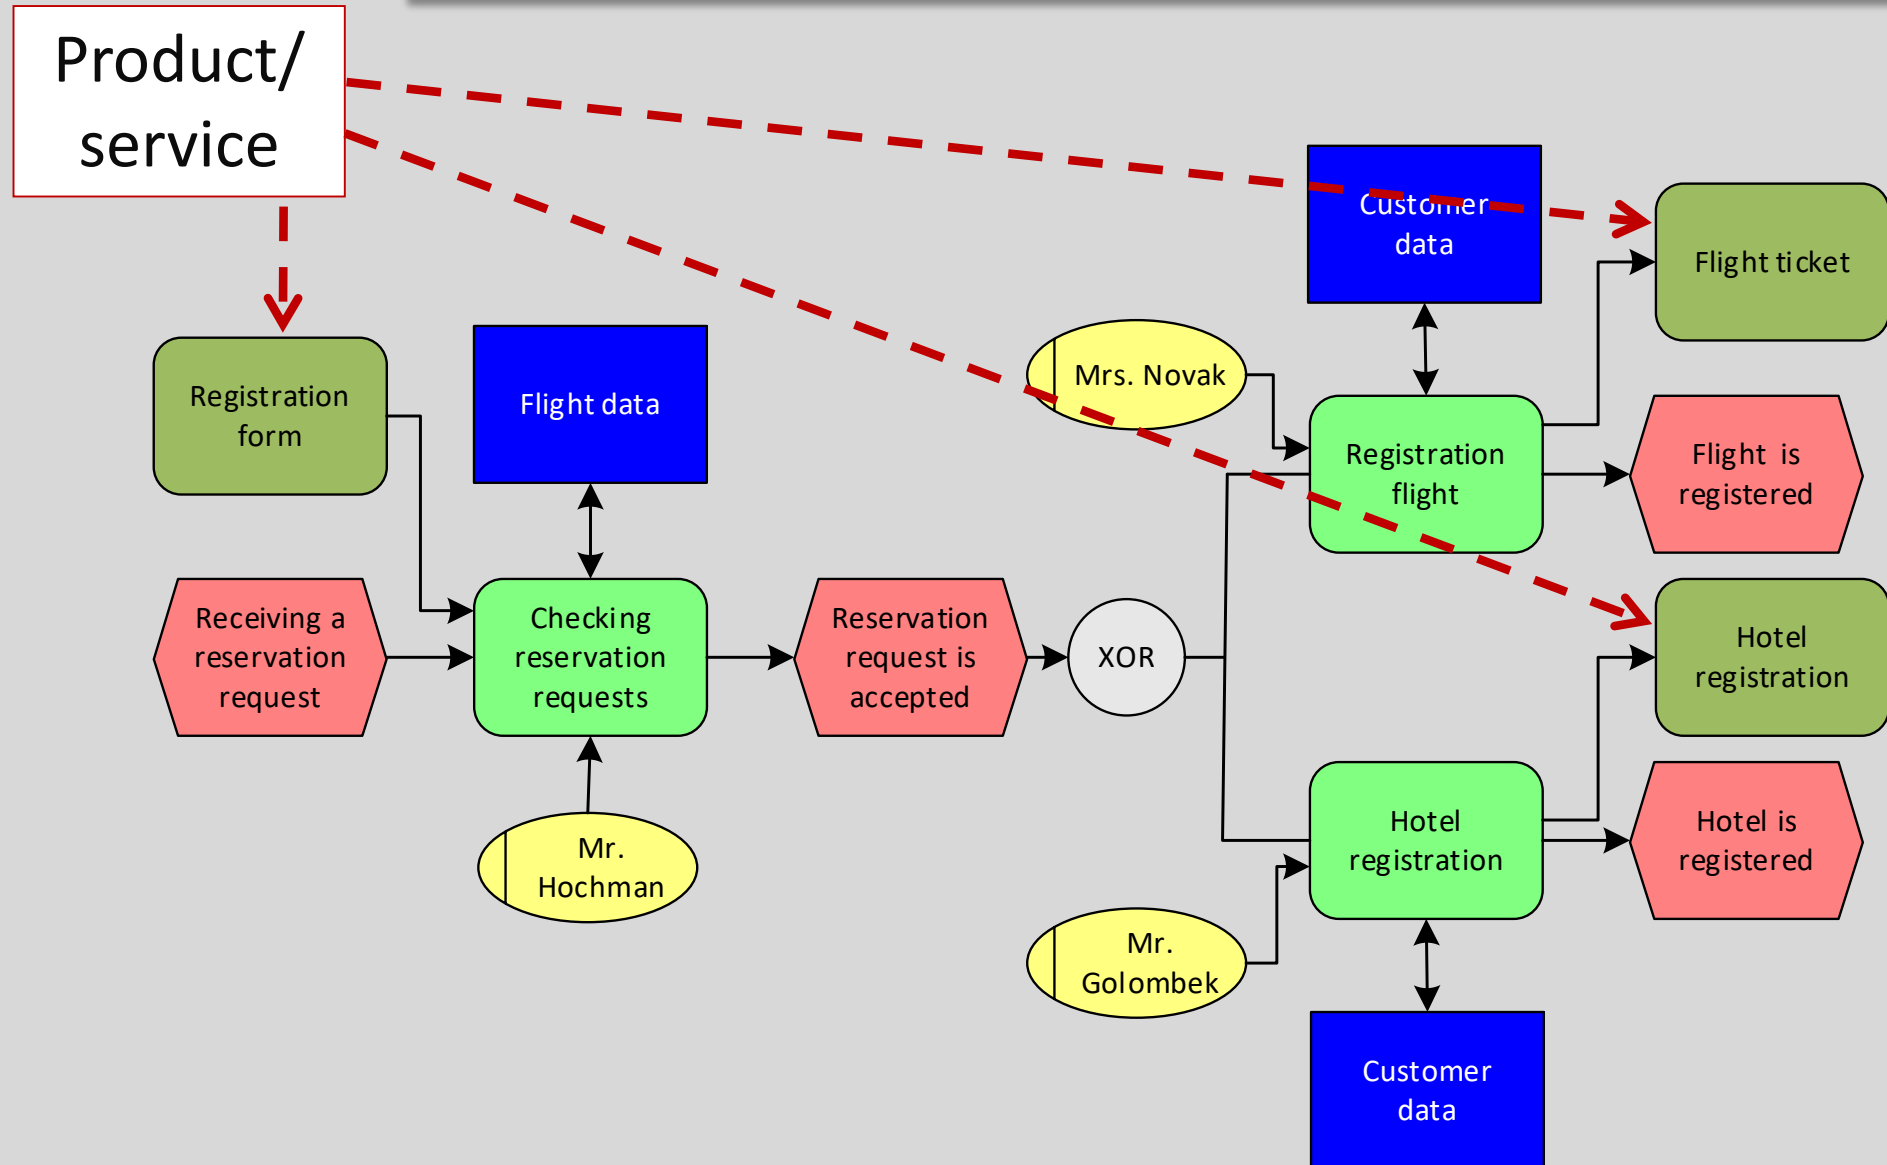

Functions are performed by employees  
(organization unit).

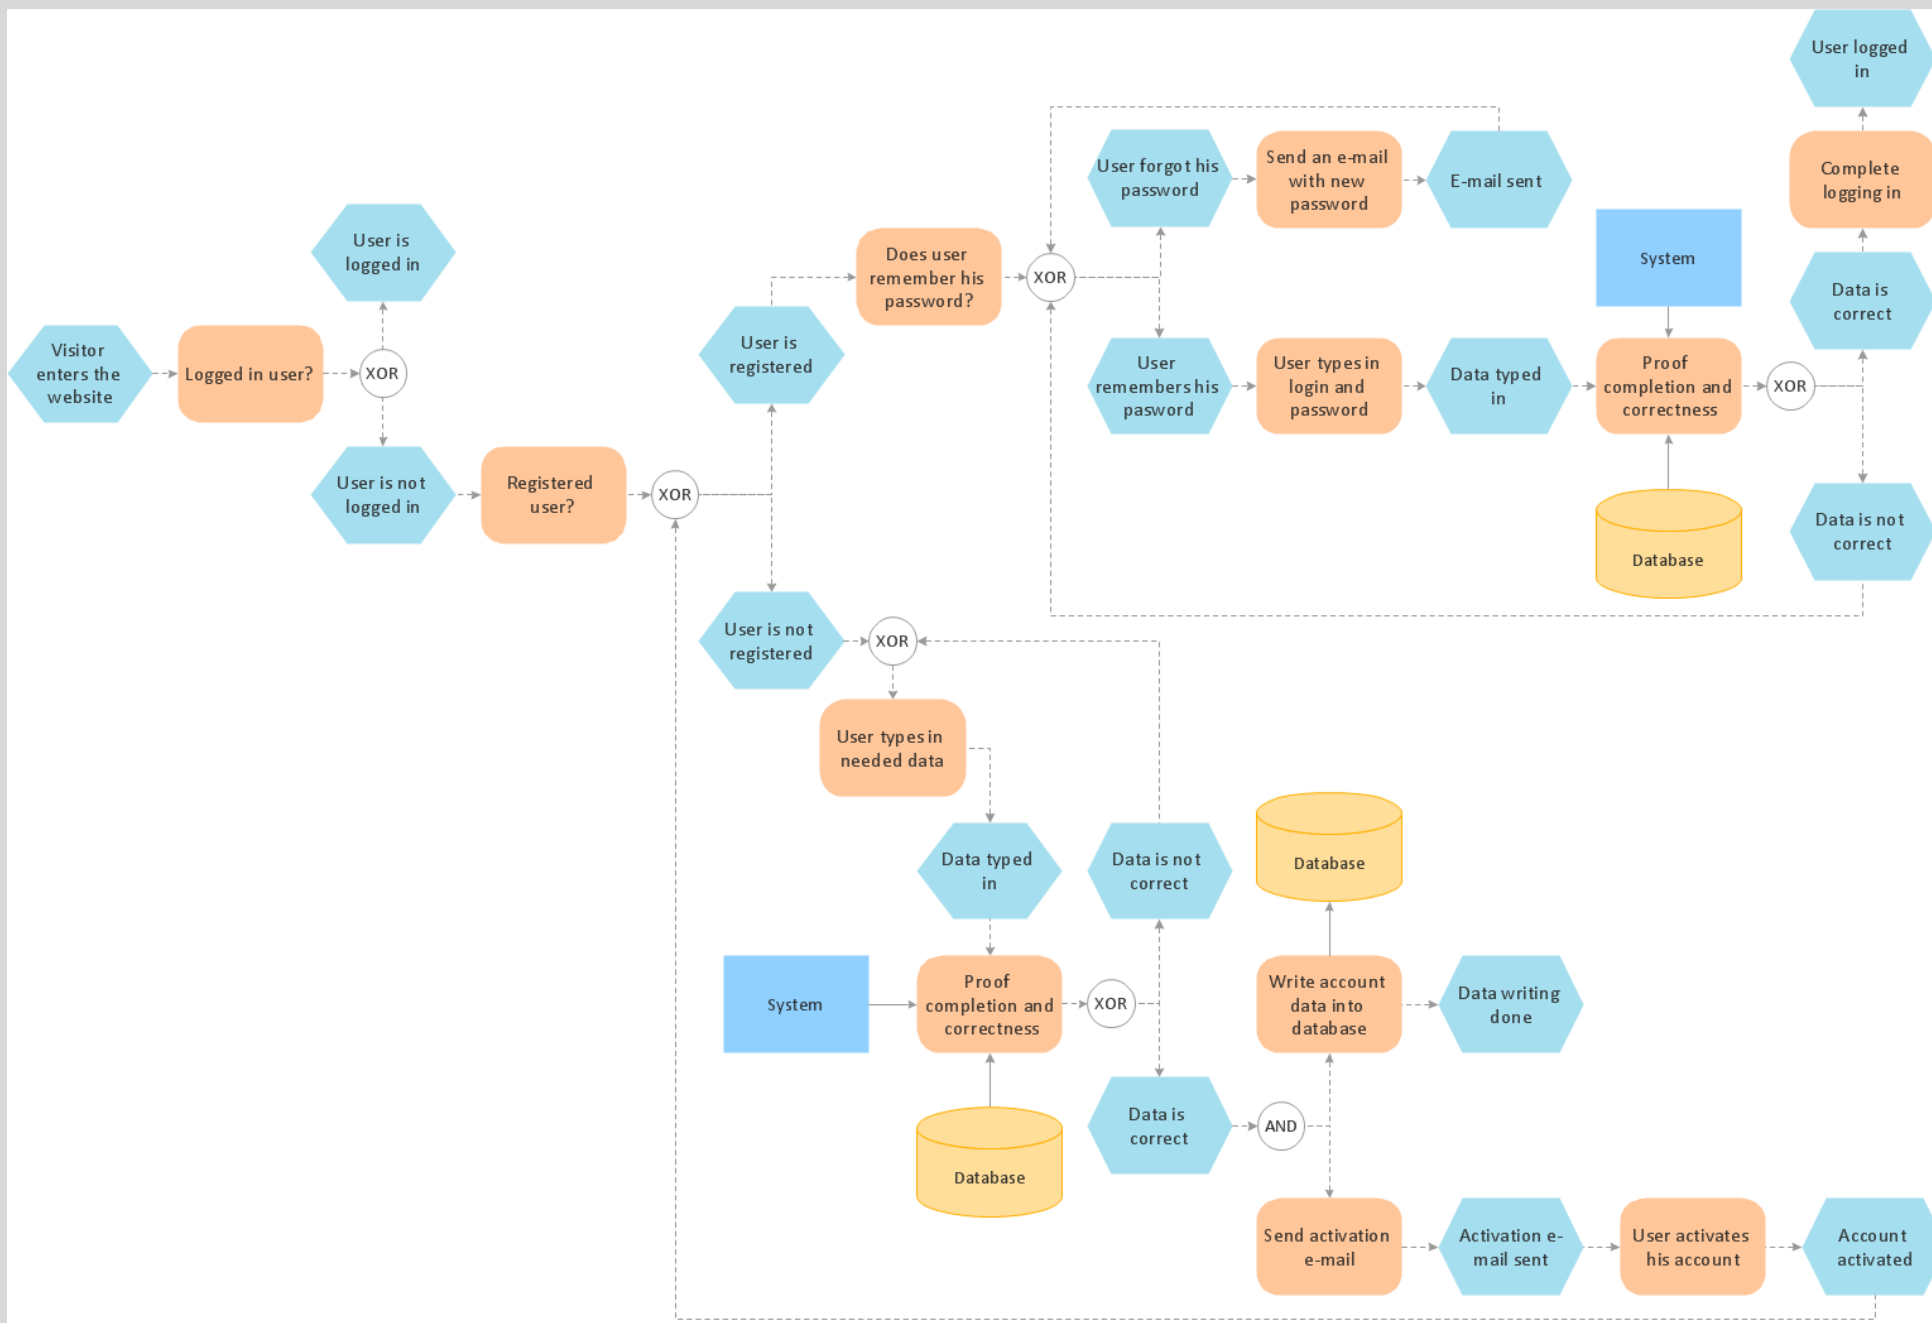

Functions create and process products / services.

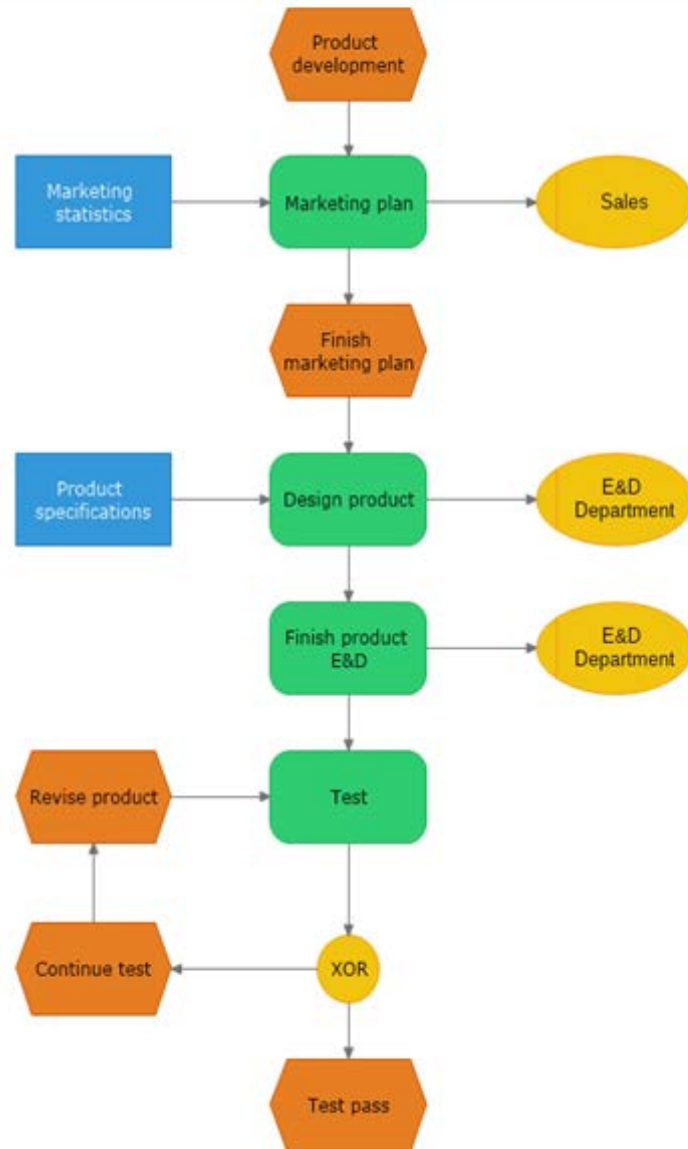

## Product Development EPC
